Foreword

This translation has been made based on the original Japanese Industrial Standard revised by the Minister of Economy, Trade and Industry through deliberations at the Japanese Industrial Standards Committee as the result of proposal for revision of Japanese Industrial Standard submitted by Battery Association of Japan (BAJ)/Japanese Standards Association (JSA) with the draft being attached, based on the provision of Article 12 Clause 1 of the Industrial Standardization Law applicable to the case of revision by the provision of Article 14.

Consequently **JIS D 5301 : 1999** is replaced with this Standard.

This revision has been made based on **IEC 60095-1 : 2000 Lead-acid starter batteries—Part 1: General requirements and methods of test**, **IEC 60095-2 : 1984 Lead-acid starter batteries Part 2: Dimensions of batteries and dimensions and marking of terminals**, Amendment 1 (1991) and Amendment 2 (1993), and **IEC 60095-4 : 1989 Lead-acid starter batteries Part 4: Dimensions of batteries for heavy trucks** and Amendment 1 (1996) for the purposes of making it easier to compare this Standard with International Standard; to prepare Japanese Industrial Standard conforming with International Standard; and to propose a draft of an International Standard which is based on Japanese Industrial Standard.

Attention is drawn to the possibility that some parts of this Standard may conflict with a patent right, application for a patent after opening to the public, utility model right or application for registration of utility model after opening to the public which have technical properties. The relevant Minister and the Japanese Industrial Standards Committee are not responsible for identifying the patent right, application for a patent after opening to the public, utility model right or application for registration of utility model after opening to the public which have the said technical properties.

Date of Establishment: 1951-07-30

Lead-acid starter batteries

Introduction This Japanese Industrial Standard has been prepared based on the sixth edition of **IEC 60095-1** *Lead-acid starter batteries—Part 1: General requirements and methods of test* published in 2000, the third edition of **IEC 60095-2** *Lead-acid starter batteries Part 2: Dimensions of batteries and dimensions and marking of terminals* published in 1984, Amendment 1 published in 1991 and Amendment 2 published in 1993, and the first edition of **IEC 60095-4** *Lead-acid starter batteries Part 4: Dimensions of batteries for heavy trucks* published in 1989 and Amendment 1 published in 1996 with some modifications of the technical contents.

The portions given continuous sidelines and dotted underlines are the matters in which the contents of the original International Standards have been modified. A list of modifications with explanations is given in Annex 2 (informative).

1 Scope This Standard specifies lead-acid batteries with a nominal voltage of 12 V (hereafter referred to as “batteries”) used for starting of internal combustion engine, lighting, ignition, etc. of automobiles, etc. However, the valve-regulated lead-acid batteries for automobile, and batteries for rolling stock, for electric automobiles, and for motorcycle are excluded.

NOTES 1 In this Standard, automobiles, etc. mean, in addition to ordinary automobile, industrial vehicles (eliminating motor-driven vehicles such as forklift tracks, tow tractors, carrying vehicles), machinery used for public works and agricultural vehicles (such as tire rollers, tractors) and other vehicles for similar applications, or power supply use in incidental facilities (such as audio, wiper) of internal combustion engine-driven vehicles.

2 The International Standards corresponding to this Standard are as follows.

In addition, symbols which denote the degree of correspondence in the contents between the relevant International Standards and **JIS** are IDT (identical), MOD (modified), and NEQ (not equivalent) according to **ISO/IEC Guide 21**.

IEC 60095-1:2000 *Lead-acid starter batteries—Part 1: General requirements and methods of test* (MOD)

IEC 60095-2:1984 *Lead-acid starter batteries Part 2: Dimensions of batteries and dimensions and marking of terminals*,
Amendment 1 (1991) and Amendment 2 (1993)
(MOD)

IEC 60095-4:1989 *Lead-acid starter batteries Part 4: Dimensions of batteries for heavy trucks* and Amendment 1 (1996)
(MOD)

2 Normative references The following standards contain provisions which, through reference in this text, constitute provisions of this Standard. The most recent editions of the standards (including amendments) indicated below shall be applied.

JIS B 7411 Solid-stem general purpose liquid-in-glass thermometers

JIS B 7507 Vernier, dial and digital callipers

JIS B 7525 Density hydrometers

JIS C 1102-2 Direct acting indicating analogue electrical measuring instruments and their accessories Part 2: Special requirements for ammeters and voltmeters

JIS C 60068-1 Environmental testing Part 1: General and guidance

3 Terms and definitions For the purposes of this Standard, the following definitions apply.

- a) **nominal voltage** the voltage used to designate a battery voltage

Generally, a little lower voltage than the electro-motive force at a full charge is applied. For the lead-acid batteries, it is 2 V per unit cell.

- b) **nominal reserve capacity $C_{r,n}$** the duration (in min) in which the full charged battery at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ is capable of discharging successively with 25 A by the cut-off voltage of 10.5 V

- c) **effective reserve capacity $C_{r,e}$** the actual duration (in min) in which the full charged battery held at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ has discharged successively with the current of $25\text{ A} \pm 1\%$ by the voltage of $10.50\text{ V} \pm 0.05\text{ V}$

The obtained discharging time expressed in min is used to ensure $C_{r,n}$.

- d) **5 h rate capacity $C_{5,n}$** the electric quantity that the full charged battery at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ is capable of supply by the cut-off voltage of 10.5 V at 5 h rate current

- e) **effective 5 h rate capacity $C_{5,e}$** the product of time in which the full charged battery held at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ is capable of discharging successively by $10.50\text{ V} \pm 0.05\text{ V}$ with 5 h rate current, and the current

The obtained electric quantity is used to ensure $C_{5,n}$.

- f) **5 h rate current I_5** the current (A) which expresses the amount of charging current and discharging current of the battery and is obtained by dividing 5 h rate capacity by 5

- g) **20 h rate capacity $C_{20,n}$** the electric quantity that the full charged battery at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$ is capable of supply by the cut-off voltage 10.5 V at 20 h rate current

- h) **20 h rate current I_{20}** the current (A) which expresses the amount of charging current and discharging current of the battery, and is obtained by dividing 20 h rate capacity by 20

- i) **nominal cold cranking ampere I_{cc}** the discharging current which expresses the scale of the engine cranking performance of the battery, and is specified so that the discharging voltage at a temperature of $-18^{\circ}\text{C} \pm 1^{\circ}\text{C}$ after 30 s shall be 7.2 V or over

- j) **high rate discharge characteristics** the characteristics discharged with the current comparable to the cranking current of automobile
- k) **cut-off voltage of discharging** the terminal voltage of the battery when discharging is ceased
- l) **charge acceptance** the characteristics which shows the ease of charging to the discharged battery
- m) **heavy load endurance** applied for Class B battery (mainly for trucks, buses, taxis, industrial vehicles, machinery used for public works and similar applications), and the number of runs of the charging and discharging cycle until the endurance in the heavy load range in which the discharged quantity of one time is 20 % or over of the 5 h rate capacity
- n) **light load endurance** applied for Class A battery (mainly for passenger vehicles, light commercial vehicles and similar applications), and the number of runs of the charging and discharging cycle until the endurance in the light load range in which the discharged quantity is 10 % or under of the 5 h rate capacity
- o) **water consumption** the amount of battery electrolyte decreased by over-charging
- p) **small water consumption battery** the battery whose water consumption is less than 4 g/Ah in clause 2 of Annex 1 (informative)

The capacity used for the calculation of water consumption shall be 20 h rate capacity $C_{20,n}$ obtained by the conversion formula with the effective reserve capacity $C_{r,e}$.
- q) **very small water consumption battery** the battery whose water consumption is less than 1 g/Ah in clause 2 of Annex 1 (informative)

The capacity used for the calculation of water consumption shall be 20 h rate capacity $C_{20,n}$ obtained by the conversion formula with the effective reserve capacity $C_{r,e}$.
- r) **charge retention** the cranking performance of the charged battery filled with electrolyte after conserved in open circuit under the specified condition of temperature and time
- s) **dry charged battery** the battery which is immediately activated and capable of being used by filling proper electrolyte, and satisfies the requirements in clause 4 of Annex 1 (informative)
- t) **vibration resistance** the battery ability to hold the working condition under the periodic or irregular accelerating force
- u) **electrolyte retention** the battery ability to hold the electrolyte under the specified mechanical condition

4 Classification The classifications of batteries shall be as shown table 1 and table 2 and divided into Class A which is mainly for passenger vehicles, light commercial vehicles and similar applications, and Class B which is mainly for trucks, buses, taxis, industrial vehicles, machinery used for public works and similar applications. Major dimensions shall be as shown in figure 1.

NOTES 1 The meaning of numeral and symbol used for the type is as follows.

First numeral: performance ranking

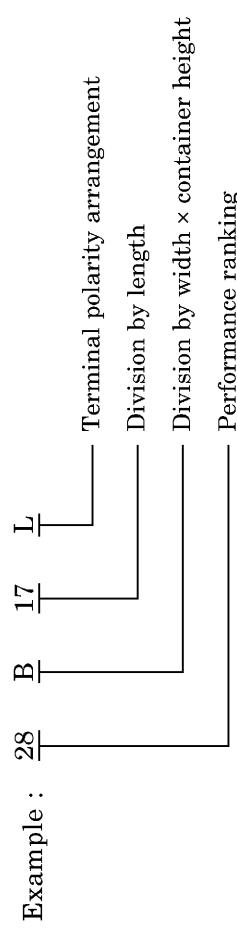

Performance ranking shall be obtained by the formula shown below.

$$\text{Performance ranking} = (\text{CCA} \times \text{RC})^{1/2}/2.8$$

Symbol next to numeral: Division of B to H by width \times container height of battery

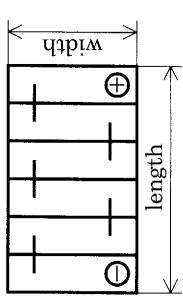

Numerals next to symbol: Approximate numeral of battery length in cm

Symbol at end: Division by the terminal polarity arrangement

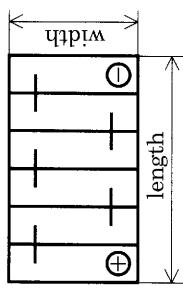

- 2 Those of which “width \times container height classification” is B to E have two types of terminal polarity arrangement. When the symbol at end is L, the arrangement shall be as shown in figure 2.
In the reverse case, L is changed with R and the arrangement is as shown in figure 3. Those of R in the symbol at end are to be withdrawn in the future.
- 3 Those with no symbol at end and the division of width \times container height is F to H shall be as shown in figure 4.
- 4 All performance values are those at an electrolyte density of 1.280 g/cm³ (20 °C).
- 5 Terminal arrangement symbols T₁ and T₂ shall be as shown in table 4.
The type in which the terminal division is indicated shall be as follows.
When using T₂ of types expressed as T₁ or T₂, they shall be identified by adding “(S)” at end.

Example: 28B17L(S)

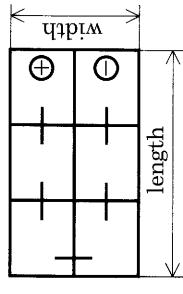

Note: \ominus is the position of positive terminal.
 \oplus is the position of negative terminal.

Figure 2 **Battery of L**

Note: \oplus is the position of positive terminal.
 \ominus is the position of negative terminal.

Figure 4 **Battery with no symbol at end**

5 Condition on delivery Batteries can be delivered under either of the following conditions.

- a) The state of ready for use, filled with the appropriate electrolyte to the maximum level. After an initial charge [according to **9.4.2 a), b) and c)**], the electrolyte density shall be as follows (unless otherwise the density recommended by the manufacturer).
- b) The dry charged state not filled with electrolyte. The electrolyte density to be filled to the battery before use shall be as follows (unless otherwise the density recommended by the manufacturer).
 - The electrolyte density shall be usually $1.280 \text{ g/cm}^3 \pm 0.010 \text{ g/cm}^3$ at 20°C at full charge.
 - The temperature conversion shall be as follows.

$$D_{20} = D_t + 0.0007(t - 20)$$

where, D_{20} : electrolyte density at 20°C (g/cm^3)

D_t : electrolyte density at $t^\circ\text{C}$ (g/cm^3)

t : electrolyte temperature at the measurement of density ($^\circ\text{C}$)

6 Performance The performance shall be as shown in table 3 when tested in accordance with **9.5**.

Table 3 Performance

Item	Performance	Applicable subclause for test methods
Dimensions	Shall satisfy the following dimensions.	9.5.1
External dimensions	Within the range shown in table 1 and table 2.	
Terminal dimensions	Within the range shown in table 5.	
Capacity	Shall satisfy either of the following.	9.5.2
RC	$C_{r,e}$ shall be not less than the value shown in table 1 and table 2.	
5 h rate	C_5 shall be not less than 95 % of the value shown in table 1 and table 2.	
Cranking performance	Shall satisfy either of the following.	9.5.3
CCA	Discharged with the current shown in table 1 and table 2 and the voltage after 30 s shall be not less than 7.2 V.	
High rate discharge characteristics	The voltage after duration, 5 s and 30 s shall be not less than the value shown in table 1 and table 2.	
Charge acceptance	Shall satisfy either of the following.	9.5.4
Test 1	Charge acceptance rate i_{ca1} is not less than 2.	
Test 2	Charging current I_{ca2} after 10 min is not less than the value shown in table 1 and table 2.	

Table 3 (concluded)

Item	Performance	Applicable subclause for test methods
Endurance	Shall satisfy either of the following.	9.5.5
Light load endurance (Class A)	The number of runs until the endurance shall be not less than 80 % of the value shown in table 1 and table 2.	
Heavy load endurance (Class B)	The number of runs until the endurance shall be not less than 95 % of the value shown in table 1 and table 2. However, the duration of battery without glass mats shall be not less than 80 % of the value shown in table 1 and table 2.	
Vibration resistance	There shall be no abnormal voltage drop due to internal short circuit, falling of plate, break of cell post, and so on, and be free from cracking or fissure of container or excessive overflow of electrolyte.	9.5.6
Strength of terminals	There shall be no twist off of the terminal, loosening in fitting of the terminal and cover or damage in the cover.	9.5.7
Robustness to fastening	There shall be no deformation or the like detrimental to service on battery.	9.5.8

7 Structure

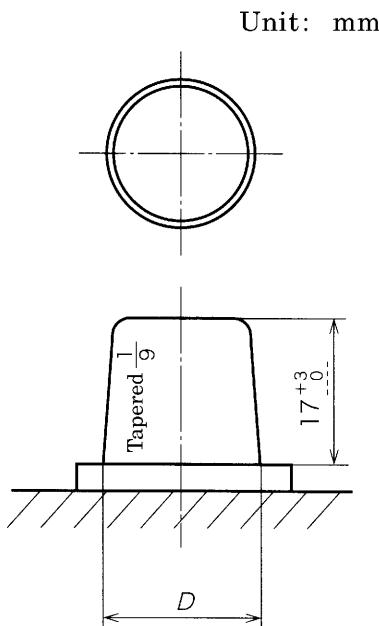

7.1 Structure general A battery is composed of a container, a cover, a positive plate, a negative plate, electrolyte and so on. The container and the cover are sealed by welding or adhesion with sealing material, unit cells are connected and one positive terminal and one negative terminal respectively are equipped. The maximum level indicator shall be provided for the one capable of water filling.

7.2 Terminal Terminals shall be made of lead alloy as divided in table 4.

T_1 and T_2 shall be the tapered terminals and the shapes and dimensions are as shown in figure 5 and table 5.

Table 4 Division of terminal

Division		Symbol
Tapered terminal	Thin type	T_1
	Thick type	T_2

**Figure 5 Tapered terminal T₁, T₂****Table 5 D dimension of terminals T₁, T₂**

Classification of terminals	D dimension	
	Positive terminal	Negative terminal
T ₁	14.7 _{-0.3} ⁰	13.0 _{-0.3} ⁰
T ₂	19.5 _{-0.3} ⁰	17.9 _{-0.3} ⁰

7.3 Vent plug When the screwed-type vent plug is used, nominal dimensions of the screw are 18 mm, 22 mm and 30 mm and usually the pitch shall be 2.5 mm.

8 External dimensions The external dimensions are as shown in table 1 and table 2.

9 Tests

9.1 Sampling of battery for testing All tests shall be carried out on the specimen of the new battery. The specimen shall be considered as new when

- a) within 30 days after the manufacturer shipping date for the charged battery filled with electrolyte;
- b) within 60 days after the manufacturer shipping date for the dry charged battery.

9.2 Testing states The testing states shall be 15 °C to 35 °C in temperature and 25 % to 75 % in relative humidity as specified in **JIS C 60068-1** unless otherwise specified. The electrolyte temperature while charging shall be keep at 15 °C to 45 °C.

9.3 Activation of dry charged battery The dry charged battery shall be filled with the appropriate electrolyte to the maximum level indicated by internal or external marks of the battery or in accordance with the manufacturer's instructions.

9.4 Testing conditions

9.4.1 Instruments The instruments shall be as follows unless otherwise specified.

- a) **Temperature measurement** The thermometer shall be of the one with tolerance of $\pm 1^{\circ}\text{C}$ specified in **JIS B 7411** or the one with the same or better accuracy.
- b) **Length measurement** The length meter shall be callipers specified in **JIS B 7507** or the measuring apparatus with the same or better accuracy.
- c) **Density measurement** The hydrometer shall be the hydrometer with tolerances of $\pm 0.005 \text{ g/cm}^3$ specified in **JIS B 7525** or the one with the same or better accuracy.
- d) **Voltmeter and ammeter** The voltmeter and ammeter shall be the instruments having accuracy of Grade 1 or better specified in **JIS C 1102-2** or the one with the same or better accuracy.
- e) **Time measurement** The timer shall be graduated in hours, minutes, seconds or in hours and centihours ($= 1/100 \text{ h}$), and they shall have an accuracy of at least $\pm 1\%$.

9.4.2 Charging Charging shall be performed in either of the following methods. The condition of completed charging is called as the full charge. All tests shall be performed in full charge condition, and the height of electrolyte shall be the maximum level.

- a) **Constant current charging method 1** The battery is charged with 5 h rate current I_5 until the terminal voltage or the electrolyte density converted to temperature shows a constant value three times consecutively on every 15 min measurement.
- b) **Constant current charging method 2** The battery is charged with current $2I_{20}$ that is twice 20 h rate current I_{20} until the terminal voltage or the electrolyte density converted to temperature shows a constant value three times consecutively on every 15 min measurement.

I_{20} shall be calculated from nominal reserve capacity $C_{r,n}$ by the following conversion formula.

$$\text{Conversion formula: } I_{20} = 1.2429 C_{r,n}^{0.8455}/20$$

where, I_{20} : 20 h rate current (A)

$C_{r,n}$: nominal reserve capacity (min)

The value, I_{20} , obtained from the conversion formula is shown in table 6.

Table 6 I_{20} current for each battery type

Unit: A

Type	I_{20}	Type	I_{20}	Type	I_{20}	Type	I_{20}	Type	I_{20}

46B24	1.9	105D31	3.9	210H52	9.4	65D26	2.8		
55B24	2.1	115E41	4.8	245H52	10.0	65D31	3.0		

- c) **Constant voltage—constant current charging method** After charging with constant voltage 14.8 V and with the current 5 I_{20} that is fivefold I_{20} as the limit current for 18 h, charging shall be kept with current I_{20} for 6 h.

9.5 Testing methods

9.5.1 Dimensions The external dimensions (overall height, container height, width and length) shown in table 1 and table 2, and the maximum point of terminal dimensions shown in figure 4 and table 5 shall be measured with the calliper specified in **JIS B 7507** or measuring apparatus having the same or better accuracy.

9.5.2 Capacity test The capacity test shall be performed in either of the following methods. However, when the capacity does not reach the performance specified in table 3, the test may be carried out further two times, namely three times in total.

It is preferable to perform the reserve capacity test preferentially, because 5 h rate capacity test is planned to be withdrawn in the future.

a) **Reserve capacity (RC) test $C_{r,e}$**

- 1) Throughout the test, the battery shall be placed in a water bath at 25 °C ± 2 °C. The water surface shall be 15 mm to 25 mm below the upper surface of the battery. If several batteries are in the same water bath then the distance between them and also the distance to the walls of the bath shall be at least 25 mm.
- 2) After the completion of charging according to **9.4.2** and between 1 h to 5 h lapse, confirm that the temperature of the electrolyte of either cell in the centre position is 25 °C ± 2 °C. Then the battery shall be discharged with current of 25 A ± 1 % until the terminal voltage falls to 10.50 V ± 0.05 V. The duration t (min) of discharging shall be recorded.
- 3) Record the electrolyte temperature T °C at the end of discharging, and calculate the effective reserve capacity $C_{r,e}$ by the following formula.

$$C_{r,e} = t [1 - 0.009 (T - 25)] \text{ (min)}$$

where, $C_{r,e}$: effective reserve capacity (min)

t : duration of discharging (min)

T : electrolyte temperature ($^{\circ}\text{C}$)

b) **5 h rate capacity test $C_{5,\text{e}}$**

- 1) Throughout the test, the battery shall be placed in a water bath at $25\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$. The water surface shall be 15 mm to 25 mm below the upper surface of the battery. If several batteries are in the same water bath then the distance between them and also the distance to the walls of the bath shall be at least 25 mm.
- 2) After the completion of charging according to **9.4.2** and approximately 1 h lapse, confirm that the temperature of the electrolyte of either cell in the centre position is $25\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$. Then the battery shall be discharged with current of 5 h rate current I_5 until the terminal voltage falls to $10.50\text{ V} \pm 0.05\text{ V}$. The duration t (h) of discharging shall be recorded.
- 3) Calculate the 5 h rate capacity $C_{5,\text{e}}$ by the following formula.

$$C_{5,\text{e}} = I_5 \times t \text{ (Ah)}$$

where, $C_{5,\text{e}}$: 5 h rate capacity (Ah)

I_5 : 5 h rate current (A)

t : duration of discharging (h)

9.5.3 Cranking performance test The cranking performance test shall be performed in either of the following methods. However, when the performance does not reach the one specified in table 3, the test may be carried out further two times, namely three times in total.

It is preferable to perform the cold cranking ampere test preferentially, because the high rate discharge characteristics test is planned to be withdrawn in the future.

a) **Cold cranking ampere (CCA) test**

- 1) After the completion of charging according to **9.4.2** and approximately between 1 h to 5 h lapse, the battery shall be placed in a cooling chamber at a temperature of $-18\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$ for a minimum of 24 h or until the temperature of the electrolyte of either cell in the centre position has reached $-18\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$.
- 2) The battery shall then be discharged within 2 min after the cooling with nominal cold cranking current I_{cc} for 30 s as shown in table 1 and table 2. This discharging current shall be kept constant to within $I_{cc} \pm 0.5\%$ while discharging.
- 3) The terminal voltage after 30 s from the start of discharging shall be recorded.

Information : The following subsidiary test may be performed for reference.

- The voltage after 10 s is also recorded in the cold cranking ampere test.
- The voltage after 10 s is 7.5 V or over.

- After the cold cranking ampere test, the battery is left for $20\text{ s} \pm 1\text{ s}$.
- The duration t (s) of discharging is recorded when the battery is discharged with the discharge current of $0.6 I_{cc}$ until the voltage falls to 6 V. This discharging current shall be kept constant to within $0.6 I_{cc} \pm 0.5\%$ while discharging.
- The duration t (s) of discharging is 40 s or over, and the total duration t (s) of discharging is 90 s ($30/0.6\text{ s} + 40\text{ s}$) or over.

b) **High rate discharge characteristics test (-15 °C)**

- 1) After the completion of charging according to **9.4.2**, the battery shall be placed in a cooling chamber at a temperature of $-15\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$ at least for 16 h.
- 2) After confirming that the temperature of the electrolyte of either cell in the centre position is $-15\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$, the battery shall be discharged with current as shown in table 1 and table 2 until the terminal voltage falls to 6 V.
- 3) The terminal voltage after 5 s or 30 s and the duration t (min) of discharging until the terminal voltage falls to 6 V shall be recorded.

9.5.4 Charge acceptance test For the charge acceptance test, the charge acceptance test 1 shall be performed when “reserve capacity test” is chosen in **9.5.2**, and the charge acceptance test 2 when “5 h rate capacity test” is chosen.

a) **Charge acceptance test 1**

- 1) After confirming the temperature of battery electrolyte is $25\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$, the battery shall be discharged with the discharge current I which is obtained by the following formula for 5 h.

For $C_{r,e}$, use the value measured in **9.5.2**.

$$I = 1.2429 C_{r,e}^{0.8455}/10 \text{ (A)}$$

where, I : discharging current (A)

$C_{r,e}$: effective reserve capacity (min)

- 2) Immediately after discharging, the battery shall be moved to the cooling chamber at a temperature of $0\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$, and placed until the temperature of either cell in the centre position has reached $0\text{ }^{\circ}\text{C} \pm 1\text{ }^{\circ}\text{C}$.
- 3) After cooling, the battery shall be charged with the constant voltage of $14.4\text{ V} \pm 0.1\text{ V}$ at the same temperature, and the charging current I_{ca1} shall be recorded after 10 min from the start of charging.
- 4) Charge acceptance shall be specified with the charge acceptance ratio i_{ca1} and obtained by the following formula.

$$i_{ca1} = 20 I_{ca1}/1.2429 C_{r,e}^{0.8455}$$

where, i_{ca1} : charge acceptance ratio

I_{ca1} : charging current after 10 min from the start of charging (A)

$C_{r,e}$: effective reserve capacity (min)

b) **Charging acceptance test 2**

- 1) After confirming that the temperature of either cell in the centre position is $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$, the battery shall be discharged with 5 h rate current I_5 for 2.5 h.
- 2) Immediately after discharging, the battery shall be moved to the cooling chamber at a temperature of $0^{\circ}\text{C} \pm 1^{\circ}\text{C}$, and placed until the temperature of either cell in the centre position has reached $0^{\circ}\text{C} \pm 1^{\circ}\text{C}$.
- 3) After confirming the temperature of battery electrolyte is $0^{\circ}\text{C} \pm 2^{\circ}\text{C}$, the battery shall be charged with the constant voltage of $14.4\text{ V} \pm 0.1\text{ V}$ at the same temperature, and the charging current I_{ca2} shall be recorded after 10 min from the start of charging.

9.5.5 Endurance test The endurance test shall be performed in either of the following methods according to the class.

a) **Light load endurance test** Applied for the Class A battery and shall be performed by the following method using the nominal cold cranking current I_{cc} as shown in table 1 and table 2.

- 1) Throughout the test, the battery shall be placed in a water bath at $41^{\circ}\text{C} \pm 3^{\circ}\text{C}$. The water surface shall be 15 mm to 25 mm below the upper surface of the battery. If several batteries are in the same water bath then the distance between them and also the distance to the walls of the bath shall be at least 25 mm.
- 2) Connect the battery to the endurance test equipment and repeat the discharging and charging cycles as follows successively. This discharging and charging cycle comprises one turn until the endurance.

Discharging: discharging current $25.0\text{ A} \pm 0.1\text{ A}$ for $240\text{ s} \pm 1\text{ s}$

Charging: charging voltage $14.80\text{ V} \pm 0.03\text{ V}$ (limit current $25.0\text{ A} \pm 0.1\text{ A}$) for $600\text{ s} \pm 1\text{ s}$

- 3) During the test, the battery is left for 56 h at every 480 cycles, and after that, it is discharged successively with the nominal cold cranking current I_{cc} for 30 s, and the voltage after 30 s shall be recorded. Then the charging of 2) shall be performed.

This discharging and charging cycle shall be counted as the number of runs until the endurance.

- 4) The end of test shall be the timing when the voltage after 30 s in the test of 3) becomes 7.2 V or under and is confirmed that the voltage does not increase again.
- 5) The number of runs until the endurance is defined as the number of runs in which the voltage after 30 s in the test of 3) becomes 7.2 V. This number of runs until the endurance is obtained by the relation curve between the number of runs and the voltage after 30 s.

- 6) Water filling shall be done appropriately with purified water, however, shall not be done immediately before the tests of 3).
- b) **Heavy load endurance test** Applied for the Class B battery and shall be performed by the following method using 5 h rate capacity C_5 as shown in table 1 and table 2.
- 1) Throughout the test, the battery shall be placed in a water bath at $41^\circ\text{C} \pm 3^\circ\text{C}$. The water surface shall be 15 mm to 25 mm below the upper surface of the battery. If several batteries are in the same water bath then the distance between them and also the distance to the walls of the bath shall be at least 25 mm.
 - 2) Connect the battery to the endurance test equipment and repeat the discharging and charging cycles as follows successively. This discharging and charging cycle comprises one turn until the endurance.

Discharging: discharging current as shown in table 7 for 1 h

Charging: charging current as shown in table 7 for 5 h

Table 7 Discharging current and charging current

Unit: A		
Battery capacity (5 h rate)	48 Ah or over up to and incl. 72 Ah	Over 72 Ah up to and incl. 176 Ah
Discharging current	20	40
Charging current	5	10

NOTE : When the capacity is expressed by 20 h rate (C_{20}), 5 h rate (C_5) is obtained by the this formula. $C_5 = 0.8 C_{20}$

- 3) During the test, the battery is discharged successively at every 25 cycles with the discharging current shown in table 7 until the terminal voltage of battery falls to 10.2 V. The duration of discharging shall be recorded. After this, the battery is charged with the charging current shown in table 7 until the terminal voltage or the electrolyte density (converted to the value at 20°C) measured at every 15 min shows a constant value throughout three consecutive measurements.

This discharging and charging cycle shall be counted as the number of runs until the endurance.

- 4) The end of test shall be the timing when the capacity (Ah) obtained by the product of the discharging time and the discharging current measured in the test of 3) decreases to 50 % or less of the 5 h rate capacity $C_{5,n}$, and is confirmed that the capacity does not increase again.
- 5) The number of runs when the capacity decreases to 50 % of 5 h rate capacity shall be taken as the number of runs until the endurance.

The number of runs until the endurance is obtained by the relation curve between the number of runs and the capacity.

- 6) Water filling shall be done appropriately with purified water, however, shall not be done immediately before the tests of 3).

9.5.6 Vibration resistance test The vibration resistance test shall be carried out under the following conditions and abnormality of the battery shall be examined.

- a) **Discharging current** 5 h rate current I_5 , or the current of $0.8 C_{20}/5$
- b) **Direction of vibration** vertical simple harmonic motion
- c) **Peak to peak amplitude** 2.3 mm to 2.5 mm
- d) **Acceleration** 29.4 m/s^2
- e) **Duration of vibration** 2 h

9.5.7 Terminal strength test The terminal strength test shall be performed in such a way that appropriate adapters are fitted to positive and negative terminals, a torque is applied to the adapter using a torque wrench in the direction of rotation illustrated in figure 6 while the torque being $11.8 \text{ N}\cdot\text{m}$ for a thin type tapered terminal T_1 , and $14.7 \text{ N}\cdot\text{m}$ for a thick terminal T_2 , and the abnormality on the terminal part is examined.

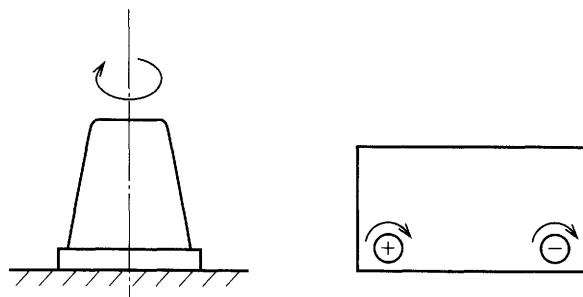

Figure 6 Rotation direction of torque wrench

9.5.8 Fastening robustness test The fastening robustness test shall be carried out in accordance with the following method and abnormality of the battery shall be examined.

- a) The battery is fastened vertically, diagonally or horizontally as illustrated in figure 7. The fastening conditions shall be as shown in table 8.
- b) The ambient temperature during the test shall be 60°C to 65°C .
- c) The test shall be performed for 5 h after fastening, and the states of battery during test period and after test shall be examined.

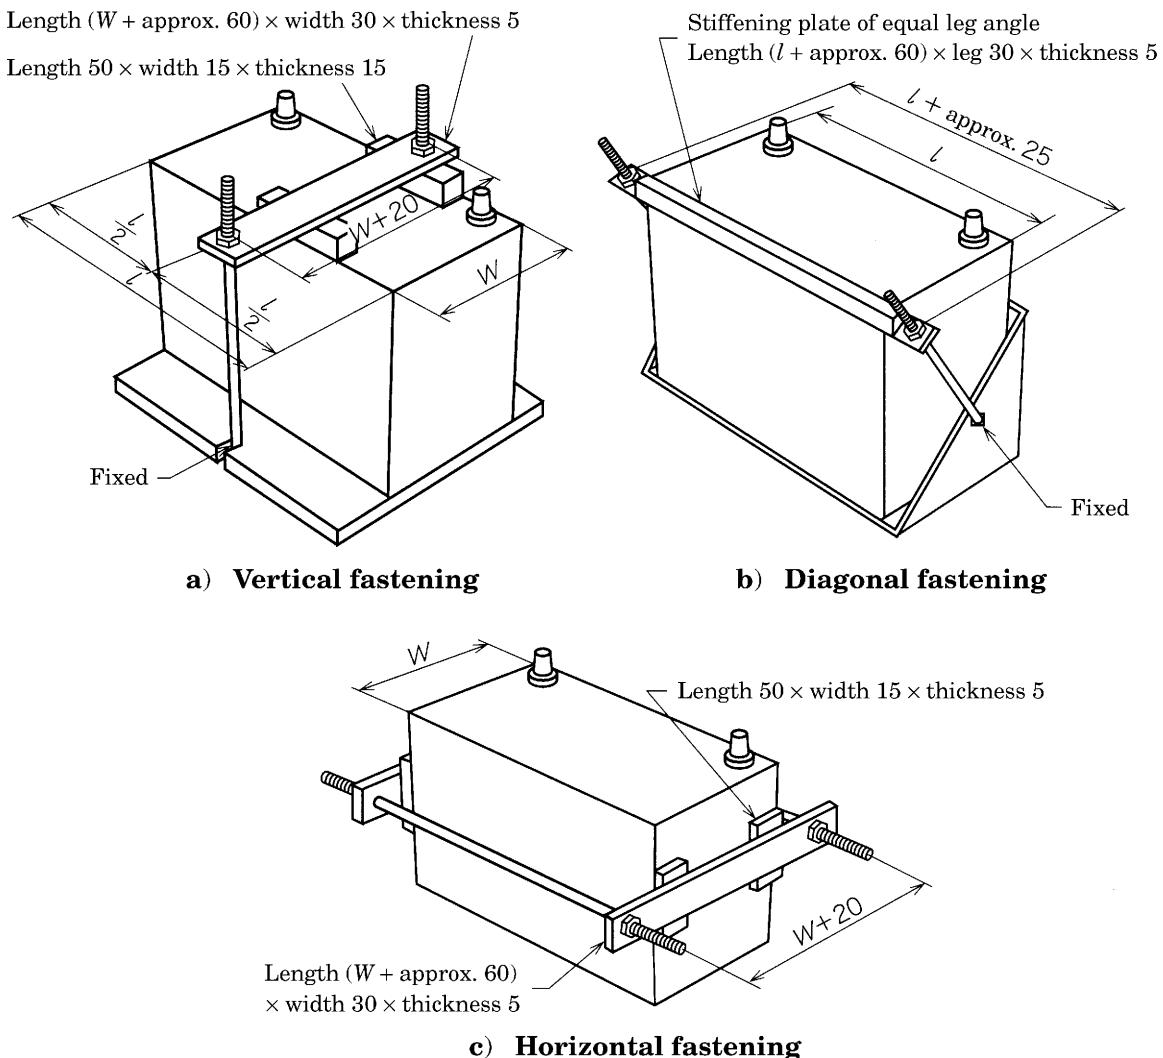

Figure 7 Fastening method

Table 8 Fastening condition

5 h rate capacity as shown in table 1 and table 2 Ah	Fastening method	Fastening load per one bolt N
72 or under	Vertical or horizontal	980
Over 72	Diagonal or horizontal	1 960

NOTE : Fastening is performed at 15 °C to 35 °C.

9.5.9 Other tests The charge retention test, water consumption test, electrolyte retention test and cranking performance test for dry charged batteries after activation which are specified in **IEC 60095-1** shall be as shown in Annex 1.

9.6 Sequence of tests The sequence of tests shall be as shown in table 9. However, when a battery can not satisfy the specified performance of capacity and cranking performance, the test may be carried out further two times, namely three times in

total. When the performance satisfies the specification, **9.5.4** to **9.5.6** shall be carried out subsequently.

These tests shall be started within one week after the completion of the cranking performance test. The sequence of **9.5.7** and **9.5.8** shall be optional.

Table 9 Sequence of test

Test		Battery				
Items	Subclause	1	2	3	4	5
Capacity test	9.5.2	<input type="circle"/>				
Cranking performance test	9.5.3	<input type="circle"/>				
Charge acceptance test	9.5.4	<input type="circle"/>				
Endurance test	9.5.5			<input type="circle"/>		
Light load endurance test or Heavy load endurance test						
Vibration resistance test	9.5.6			<input type="circle"/>		

NOTE : Five batteries shall be prepared. Batteries 4 and 5 may be used for any test.

10 Inspection The battery shall comply with the provisions of clause **6** and clause **8** when the test is carried out in accordance with clause **9**. When agreed between the parties concerned with delivery, a part of these items may be omitted.

- a) Dimension
- b) Capacity (reserve capacity or 5 h rate)
- c) Cranking performance [cold cranking current or high rate discharge characteristics (-15 °C)]
- d) Charge acceptance (test 1 and test 2)
- e) Endurance (light load endurance or heavy load endurance)
- f) Vibration resistance
- g) Strength of terminals
- h) Robustness to fastening

11 Designation of product The product shall be designated by the name and type.

Example : Lead-acid starter battery 28B17L

12 Marking The following items shall be marked on a clearly visible place of each battery.

a) **Marking of rating**

- 1) Type

- 2) Polarity The polarity shall be marked for at least the positive terminal. For this marking, “+” mark shall be shown on the upper surface of the lid near the positive terminal or on the positive terminal. When showing also the negative polarity, “-” mark shall be shown on the upper surface of the lid near the negative terminal or on the negative terminal.
- 3) Manufacturer's name or abbreviation
- 4) Year and month of manufacture, manufacturing date or its abbreviation

Information : Abbreviation for the manufacturing date shall be as follows.

Example : 21 11 06 (Nov/21/2006)
(day) (month) (year)

- b) **Marking for safety** On batteries, six coloured symbols as shown in figure 8 shall be marked. The symbol size shall be common as shown in figure 9, and the minimum size shall be 10 mm. The meaning of the symbols is preferably expressed close to the symbols.

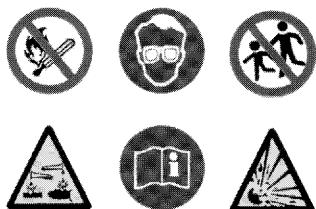

Figure 8

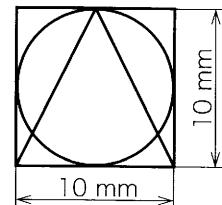

Figure 9

- **No smoking, no open fire, no sparking**
- **Protect naked eyes**
- **Keep off children**
- **Electrolyte**
- **Pay attention to instruction manual**
- **Explosive gas**

Annex 1 (informative)

General requirements and test methods

Introduction The testing methods in this Annex have been deliberated for IEC revision next time, however, there are no practical usage in Japan. Therefore, Annex 1 this time of **JIS D 5301** shows the testing methods and requirements as a reference, and is not to constitute the provisions of this Standard. In the next revision of **JIS D 5301**, the contents will be submitted for the next revision of **IEC 60095**.

1 Charge retention test

- a) A battery with its vent plugs firmly in place and a clean, dry surface shall be stored at $40^{\circ}\text{C} \pm 2^{\circ}\text{C}$ for the following period in open circuit. No connecting clamps or cables shall be attached to the terminals during storage.

Small water consumption battery 14 days

Very small water consumption battery 49 days

- b) After this storage period the battery, without recharge, shall be placed in a cooling chamber at a temperature of $-18^{\circ}\text{C} \pm 1^{\circ}\text{C}$ for a minimum of 20 h or until the temperature of either cell in the centre position has reached $-18^{\circ}\text{C} \pm 1^{\circ}\text{C}$.
- c) The battery shall be discharged within 2 min after the cooling with $0.6 I_{cc}$ that is 0.6 times the nominal cold cranking current. This discharging current shall be kept constant to within $0.6 I_{cc} \pm 0.5\%$ while discharging.
- d) The terminal voltage after 30 s from the start of discharging shall be 8.0 V or over.

2 Water consumption test

- a) After the completion of charging according to **9.4.2** of the text, clean and dry the surface of the battery, and the weigh the mass of battery (W_1) to an accuracy of $\pm 0.05\%$ or better.
- b) The battery shall be placed in a water bath at $40^{\circ}\text{C} \pm 2^{\circ}\text{C}$. The water surface shall be 15 mm to 25 mm below the upper surface of the battery. If several batteries are in the same water bath then the distance between them and also the distance to the walls of the bath shall be at least 25 mm.
- c) Charge the battery with $14.40 \text{ V} \pm 0.05 \text{ V}$ (measured across the battery terminals) for a period of 500 h.
- d) Immediately after this overcharging, clean and dry the surface of the battery, and weigh the battery mass (W_2) using the balance the same in a).
- e) Water consumption shall be calculated as follows.

$$(W_1 - W_2)/1.2429 C_{r.e}^{0.8455} (\text{g/Ah})$$

- f) The water consumption shall be the value shown below or under.

Small water consumption battery	4 g/Ah
Very small water consumption battery	1 g/Ah

3 Electrolyte retention test

- a) After the completion of charging according to **9.4.2** of the text, the battery shall be placed in open circuit at a temperature of $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 4 h.
- b) If required, the electrolyte level of each cell shall be adjusted to the maximum level with pure water. The surface of battery shall be cleaned and dried.
- c) The battery shall be tilted in back and forth and both sides directions. Each test shown below shall be performed at the interval of not less than 30 s.
 - 1) The battery shall be tilted at 45° to the upright in the maximum period of 1 s.
 - 2) The battery shall be maintained in this position for 3 s.
 - 3) The battery shall be back to the upright position in the maximum period of 1 s.
- d) After this test, no evidence of liquid shall visible on the vent plugs.

4 Cranking performance test for dry charged battery after activation

- a) The dry charged battery and the electrolyte of which amount is specified by the manufacturer shall be placed at $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for at least 12 h without filling electrolyte.
- b) The dry charged battery shall be filled with the appropriate electrolyte to the maximum level indicated by internal or external marks of the battery or in accordance with the manufacturer's instructions.
- c) After a rest period of 20 min at the same temperature, the battery shall be discharged with rated cold cranking current I_{cc} for 30 s.
- d) The terminal voltage after 30 s from the start of discharging shall be 7.2 V or over.

Annex 2 (informative)

Comparison table between JIS and corresponding International Standards

JIS D 5301:2006 Lead-acid starter batteries				IEC 60095-1:2000 Lead-acid starter batteries—Part 1: General requirements and methods of test	
				IEC 60095-2:1984 Lead-acid starter batteries Part 2: Dimensions of batteries and dimensions and marking of terminals	
				IEC 60095-4:1989 Lead-acid starter batteries Part 4: Dimensions of batteries for heavy trucks	
Clause	Content	(II) International Standard numbers	(III) Requirements in International Standards	(IV) Classification and details of technical deviation between JIS and the International Standards by clause Location of deviation: text, Annex Indication method: continuous sidelines or dotted underlines	(V) Justification for the technical deviation and future measures
Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation
1 Scope	Lead-acid batteries with a nominal voltage of 12 V used for starting of internal combustion engine, lighting, ignition, etc. of automobiles, etc. are specified.	IEC 60095-1	1.1	Lead-acid batteries with a nominal voltage of 12 V used primarily as a power source for the starting and igniting of internal combustion engines, lighting and for auxiliary equipment of internal combustion engine vehicles are specified.	MOD/alteration JIS is specified by unifying three IEC Standards. Changed for the convenience of the user of this Standard.
		IEC 60095-2	1	Lead-acid batteries with a nominal voltage of 12 V used for starting, lighting and ignition of passenger automobiles and light commercial vehicles are specified.	

(I) Requirements in JIS		(II) International Standard numbers	(III) Requirements in International Standards	(IV) Classification and details of technical deviation between JIS and the International Standards by clause	(V) Justification for the technical deviation and future measures	
Clause	Content		Clause	Content	Classification by clause	Detail of technical deviation
1 Scope (concluded)		IEC 60095-4	1	Lead-acid batteries used for starting, lighting and igniting of heavy trucks are specified.		
2 Normative references	Five JIS s are referred to. JIS B 7411 JIS B 7507 JIS B 7525 JIS C 1102-2 JIS C 60068-1	IEC 60095-1	1.2	Two IECs are referred to. IEC 60050 (486) : 1991 IEC 60095-2 : 1984	MOD/alteration	—
3 Terms and definitions	Definitions of 21 terms are specified.	IEC 60095-1	1.3	The definitions in IEC for terms are referred to. 5 Functional characteristics are explained.	MOD/alteration	—
4 Classification	Divisions by type, performance, dimensions, polarity and applications (Class A and Class B). B to E of "width × container height division" have two terminal polarity symbols, L and R.	IEC 60095-1	2.1	According to the application Class A, Class B and Class C	MOD/deletion	In JIS , Class C is deleted.
			2.2	According to the type Vented battery and valve-regulated battery	MOD/deletion	Valve-regulated lead-acid battery for automobile is deleted.

(I) Requirements in JIS		(II) International Standard numbers		(III) Requirements in International Standards		(IV) Classification and details of technical deviation between JIS and the International Standards by clause		(V) Justification for the technical deviation and future measures	
Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation	Classification by clause	Detail of technical deviation	Classification by clause	Detail of technical deviation
4 Classification (concluded)		IEC 60095-1	2.3 Division of electrolyte density by the climate	MOD/ deletion	Not divided in JIS .	In Japan, products for subtropics and tropics use are not produced.			
		IEC 60095-2	17 Dimensions and terminal polarity for series AS Class A. The terminal polarity is one type and one classification (L or R).	MOD/ addition	There are no classification by performance ranking in IEC Standards.	Performance ranking, as well as dimensions, is the important information for users and consumers when selecting, buying the battery, therefore it shall be persisted.			
		IEC 60095-4	A.2 Dimensions and terminal polarity for series AS Class B.			In IEC Standards, only terminal polarity L is defined for type B19 to E41, therefore, the terminal polarity R is planned to be withdrawn in future.			
5 Condition on delivery	Delivery conditions for the vent type battery are specified.	IEC 60095-1	3 Delivery conditions for the vent type battery and the valve-regulated type battery are specified.	MOD/ deletion	In JIS , batteries for subtropics and tropics use, and valve-regulated batteries are deleted.	In Japan, batteries for subtropics and tropics use are not produced. The valve-regulated batteries are excluded from JIS , therefore it is deleted.			
				MOD/ alteration	The reference temperature of electrolyte density is specified at 25 °C in IEC, however 20 °C in JIS .	In Japan, the design of 20 °C is conventionally adopted, therefore it is changed.			

(I) Requirements in JIS		(II) International Standard numbers	(III) Requirements in International Standards	(IV) Classification and details of technical deviation between JIS and the International Standards by clause	(V) Justification for the technical deviation and future measures
Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation
5 Condition on delivery (concluded)				MOD/ addition	The temperature conversion formula is added.
6 Performance	Dimensions, capacity, cranking performance, charge acceptance, endurance, vibration resistance, strength of terminals and robustness to fastening are specified.	—	—	MOD/ addition	For the conformity assessment, they are necessary for JIS . Testing methods for performance and suitable values are planned to be specified at the next revision of IEC Standard.
7 Structure	7.2 Terminal (thick type and thin type) are specified.	IEC 60095-2	12 13 The tapered terminal (thick type only) is specified.	MOD/ addition MOD/ alteration	In JIS , the thin type terminal is added. The dimensional tolerances on the thick terminal are changed in JIS . JIS IEC Standard Positive terminal diameter $19.5_{-0.3}^{+0}$ $19.5_{-0.2}^{+0}$ Negative terminal diameter $17.9_{-0.3}^{+0}$ $17.9_{-0.2}^{+0}$ Height 17_{-0}^{+3} 17_{-0}^{+1}

(I) Requirements in JIS		(II) International Standard numbers		(III) Requirements in International Standards		(IV) Classification and details of technical deviation between JIS and the International Standards by clause		(V) Justification for the technical deviation and future measures	
Clause	Content	Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation	Dimensions of parts necessary as JIS are specified.	
7.3 Vent plug	The nominal dimension and the pitch of the screw of the screwed-type vent plug are specified.	—	—	—	—	MOD/ addition	—	—	
8 External dimensions	The external dimensions for each class and type are specified.	IEC 60095-2 IEC 60095-4	7 4	Main dimensions are specified.	—	MOD/ addition	—	Normative items and their contents necessary as JIS are specified.	
9 Tests	Conditions of the specimen applied for the test is specified.	IEC 60095-1	6.1	Identical with JIS .	IDT	—	—	—	
9.1 Sampling of battery for testing	—	—	—	—	—	MOD/ addition	—	Normative items and their contents necessary as JIS are specified.	
9.2 Testing states	The temperature and the relative humidity of the testing environment are specified.	—	—	—	—	—	—	—	
9.3 Activation of dry charged battery	Electrolyte filling of dry-charged batteries is specified.	IEC 60095-1	6.3	Identical with JIS .	IDT	—	—	—	

(I) Requirements in JIS		(II) International Standard numbers	(III) Requirements in International Standards numbers	(IV) Classification and details of technical deviation between JIS and the International Standards by clause	(V) Justification for the technical deviation and future measures
Clause	Content		Clause	Content	Classification by clause
9.4 Testing conditions		IEC 60095-1	6.4	Almost identical with JIS .	MOD/ addition
9.4.1 Instruments	Instruments, etc. used for the test are specified.		6.2	—	—
9.4.2 Charging	The full charged condition of the battery applied for the test is specified.		6.2.1	Constant current charging of vent type battery	MOD/ alteration
	a) Constant current charging method 1 b) Constant current charging method 2				Charging cut-off condition is changed.
	c) Constant voltage—constant current charging method		6.2.2	Constant voltage charging of vent type battery	MOD/ alteration
					The charging voltage is 16 V in IEC Standard, however, it is set to 14.8 V in JIS and the end of charging is specified as constant current charging.
			6.2.3	Charging of valve-regulated battery	MOD/ deletion
					The valve-regulated batteries are excluded from JIS , therefore it is deleted.

(I) Requirements in JIS		(II) International Standard numbers		(III) Requirements in International Standards		(IV) Classification and details of technical deviation between JIS and the International Standards by clause		(V) Justification for the technical deviation and future measures

9.5 Testing methods	IEC 60095-1	7	Almost identical with JIS .			MOD/ alteration MOD/ deletion			They are specified corresponding to "6 Performance" in JIS . The charge retention test, water consumption test, electrolyte retention test and cranking performance for dry charged batteries after activation which have no practical usage in Japan are deleted.
9.5.1 Dimensions	Measuring methods of external dimensions are specified.	—	—	—	—	MOD/ addition	—		Normative items and their contents necessary as JIS are specified.
9.5.2 Capacity test	a) Reserve capacity $C_{r,e}$	IEC 60095-1	7.1 20 h rate capacity C_e 7.2 Reserve capacity $C_{r,e}$			MOD/ deletion IDT	Either C_e or $C_{r,e}$ is selected in IEC Standard. $C_{r,e}$ is selected in JIS .		Considering the conformity with not only IEC Standard but also SAE , $C_{r,e}$ is selected in JIS as the reference capacity.
	$C_{r,e} = t [1 - 0.009 (T - 25)]$	—	—	—	—	MOD/ addition	Temperature conversion formula is added.		It is planned to be added at the next revision of IEC Standard.
	b) 5 h rate capacity $C_{5,e}$	—	—	—	—	MOD/ addition	—		Normative items and their contents necessary as JIS are specified.

Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation
9.5.3 Cranking performance test	a) Cold cranking ampere (CCA) test Discharged with I_{cc} and the voltage after 30 s is 7.2 V or over. b) High rate discharge characteristics test (-15 °C)	IEC 60095-1	7.3 Discharged with I_s and the voltage after 60 s is 8.4 V or over.	MOD/ alteration	The discharging current, time and voltage are different.
9.5.4 Charge acceptance test	a) Charge acceptance test 1 Discharging current and necessary value from $C_{r,e}$ value are obtained. b) Charge acceptance test 2	IEC 60095-1	7.4 Discharging current and necessary values from $C_{r,e}$ or C_e value are obtained.	MOD/ addition	—
9.5.5 Endurance test	a) Light load endurance test b) Heavy load endurance test	— —	— —	MOD/ addition	—

Location of deviation: text, Annex

(I) Requirements in JIS		(II) International Standard numbers		(III) Requirements in International Standards		(IV) Classification and details of technical deviation between JIS and the International Standards by clause		(V) Justification for the technical deviation and future measures	
Clause	Content	Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation	Presently, IEC Standard for vibration endurance test is under review. After settled, it will be adopted into JIS .	
9.5.6 Vibration resistance test	Discharging current: 5 h rate current Direction of vibration: vertical simple harmonic motion Peak to peak amplitude: 2.3 mm to 2.5 mm Acceleration: 29.4 m/s^2 Duration of vibration: 2 h	IEC 60095-1	7.10	Discharge current: none Direction of vibration: vertical simple harmonic motion Frequency: 30 Hz to 35 Hz Acceleration: 30 m/s^2 (Class A) 50 m/s^2 (Class B) Duration of vibration: 2 h (Class A) 8 h (Class B)	MOD/ alteration	Testing conditions are different. Especially normative values of IEC Standard of Class B applied for trucks are strict.			
9.5.7 Terminal strength test	A certain torque is applied to the terminal.	—	—	—	—	MOD/ addition	—	Normative items and their contents necessary as JIS are specified.	
9.5.8 Fastening robustness test	The fastening robustness test is carried out in accordance with the actual loading method to automobiles.	—	—	—	—	MOD/ addition	—	Normative items and their contents necessary as JIS are specified.	

(I) Requirements in JIS		(II) International Standard numbers	(III) Requirements in International Standards	(IV) Classification and details of technical deviation between JIS and the International Standards by clause	(V) Justification for the technical deviation and future measures
Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation
9.5.9 Other tests	The charge retention test, water consumption test, electrolyte retention test and cranking performance for dry charged batteries after activation are specified in Annex 1.	IEC 60095-1	7.5 7.9 7.11 7.12	The charge retention test, water consumption test, electrolyte retention test and cranking performance for dry charged batteries after activation are specified in the text.	MOD/ deletion Specifications of IEC Standard are deleted, however described as reference.
9.6 Sequence of tests		IEC 60095-1	6.5.1	Almost identical with JIS .	In IEC Standard, it is necessary to perform the capacity and cranking performance test for three times, however, in JIS it is possible to perform at most three times. The contents of IEC Standard is planned to be revised to the same specification of JIS at the next revision.

(I) Requirements in JIS		(II) International Standard numbers		(III) Requirements in International Standards		(IV) Classification and details of technical deviation between JIS and the International Standards by clause		(V) Justification for the technical deviation and future measures	
Clause	Content	Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation	Classification by clause	Detail of technical deviation
10 Inspection	Testing methods for each performance item and suitable values are specified.	—	—	—	—	MOD/ addition	—	—	Specification items and contents necessary for JIS are added. Testing methods for each performance item and suitable values are planned to be specified at the next revision of IEC Standard.
11 Designation of product	Designation by the name and type are specified.	—	—	—	—	MOD/ addition	—	—	Normative items and their contents necessary as JIS are specified.
12 Marking	a) Marking of rating 1) Type	IEC 60095-1	4.1.1 4.1.2 4.1.4	Class of battery Nominal voltage Nominal cranking current	MOD/ alteration	—	—	—	Changed to the expression of type necessary as JIS . The contents including the expression of type of JIS will be added at the next revision of IEC Standard.
	2) Polarity	4.2	Almost identical with JIS .	IDT	—	—	—	—	—
	3) Manufacturer's name or abbreviation 4) Year and month of manufacturing date, or its abbreviation	—	—	MOD/ addition	—	—	—	—	Normative items and their contents necessary as JIS are specified.

Clause	Content	Clause	Content	Classification by clause	Detail of technical deviation	Classification by clause	Detail of technical deviation	Classification by clause	Detail of technical deviation
12 Marking (concluded)	b) Marking for safety The size of markings are specified in six symbols.	IEC 60095-1	4.1.5 Identical with JIS . According to Annex B. 4.1.6 Indication of valve-regulated battery	MOD/ alteration	Annex B of IEC Standard is specified in the text.	MOD/ deletion	Deleted in JIS .	The indication of the symbol meaning close to it improves the convenience for the user.	Deleted because the valve-regulated battery is excluded from JIS .
			4.3 Additional designation	MOD/ deletion	Deleted in JIS .			4.3 of IEC Standard is not normative items, therefore deleted.	
			4.4 Fastening of the battery	MOD/ deletion	Deleted in JIS .			Deleted because the contents do not fit to JIS .	
Annex 1		IEC 60095-1	7.5 7.9 7.11 7.12	The charge retention test, water consumption test, electrolyte retention test and cranking performance for dry charged batteries after activation are specified in the text.	MOD/ deletion	In JIS , storage period, discharging current after storage, terminal voltage, etc. are altered and referred.		The contents of IEC Standard will be revised to the same specification of JIS at the next revision. The contents will be specified in the text at the next revision of JIS .	

Designated degree of correspondence between **JIS** and International Standards: MOD

NOTES 1 Symbols in sub-columns of classification by clause in the comparison table indicate as follows:

- IDT: Identical in technical contents.
 - MOD/deletion: Deletes specification item(s) or content(s) in International Standard.
 - MOD/addition: Adds the specification item(s) or content(s) which are not included in International Standard.
 - MOD/alteration: Alters the specification content(s) which are included in International Standard.
- 2 Symbol in column of designated degree of correspondence between **JIS** and International Standards in the comparison table indicates as follows:
- MOD: Modifies International Standards.

Errata for JIS (English edition) are printed in *Standardization Journal*, published monthly by the Japanese Standards Association, and also provided to subscribers of JIS (English edition) in *Monthly Information*.
